

If you have already installed the WinVERS program and only wish to update to the newest version, you will need to download the WinVERS.Exe file and copy it over the existing file of the same name in your VERS root directory. To download WinVERS.Exe version 1.43, left click on the “Download winvers.exe” selection. This is a zipped formatted file. Depending on the Operating System you are using, a screen similar to this will appear.

Select the “Save” icon. A new window will open asking you to select a folder to save the file into. You can create a new folder or download the file into the folder of your choice.

Once downloaded, you will need to use a WinZip program to extract the “WinVERS.Exe” from the zipped program into the VERS root directory.

Once this has been done, the user can start using WinVERS version 1.43.

Depending on the operating system in use, some end user maybe able to select the “Open” icon from the first menu and extract the “WinVERS.Exe” file directly into the VERS root directory.

If you have any problems I can be reached at Sammy.F.Franco@erdc.usace.army.mil or 601-634-4205.

Thanks,

Sam Franco
